## **Tutorial**

Week 9

# Question 1

Which of the following statements is **false**?

- ☐ The amortized cost for insert in dynamic tables is  $\Theta(1)$ .
- ☐ In the accounting method, the amortized cost  $\hat{c}_i$  is always greater than the actual cost  $c_i$  of an operation.
- ☐  $\sum_{i=1}^n \hat{c}_i - \sum_{i=1}^n c_i \geq 0$  where  $\hat{c}_i$  and  $c_i$  are the amortized and actual costs of the  $i$ -th operation respectively.

# Question 2

- Consider a data structure that is based on a queue with four operations:
  - **ENQUEUE**(*a*): Add the element *a* into the queue
  - **DEQUEUE**(): Dequeue a single element from the queue
  - **DELETE**(*k*): Dequeue *k* elements from the queue
  - **ADD**(*A*): Enqueue all elements in *A*
- **Claim:** **ENQUEUE**, **DEQUEUE** and **DELETE** run in amortized  $O(1)$  time while **ADD** runs in amortized  $O(|A|)$  time.
- Using accounting method, can you show that these time complexities are correct?
- (Please state the charge for each operation.)

# Potential Method (Recap)

$\phi$ : Potential function associated with the algorithm/data-structure

$\phi(i)$ : Potential at the end of  $i$ th operation

Important conditions to be fulfilled by  $\phi$

$$\phi(0) = 0$$

$$\phi(i) \geq 0 \text{ for all } i$$

Amortized cost of  $i$ th operation  $\stackrel{\text{def}}{=} \text{Actual cost of } i\text{th operation} + \underbrace{(\phi(i) - \phi(i-1))}_{\Delta\phi_i = \text{Potential difference}}$

Amortized cost of  $n$  operations  $\geq$  Actual cost of  $n$  operations

# Question 3

- Consider a data structure that is based on a queue with four operations:
  - **ENQUEUE**( $a$ ): Add the element  $a$  into the queue
  - **DEQUEUE**(): Dequeue a single element from the queue
  - **DELETE**( $k$ ): Dequeue  $k$  elements from the queue
  - **ADD**( $A$ ): Enqueue all elements in  $A$
- **Claim:** **ENQUEUE**, **DEQUEUE** and **DELETE** run in amortized  $O(1)$  time while **ADD** runs in amortized  $O(|A|)$  time.
- Using Potential method, can you show that these time complexities are correct?
- (Please state your potential function.)

# Question 4

**Delete**  $x$  from  $T$ ;

$n \leftarrow n - 1$ ;

**If** ( $n = 0$ )

**free**( $T$ );

**Else**

**If**( $n = \text{size}(T)/2$ )

{  $T' \leftarrow \text{createTable}(n/2)$ ;

**copy**( $T, T'$ );

**free**( $T$ );

$T \leftarrow T'$

}

Note,  $T$  is the dynamic table that supports only deletions.

Using Potential method show that the amortized cost of each **Deletion** operation is  $O(1)$ .

(State your potential function.)
