CS3230 Mid-Semester Survey

1. Which would you find more effective, assuming that the current structure of the course with the recitation and tutorials remains the same?

No of respondents: ***104***

2	Video lectures would be more effective for me.	48	46.15%
3	Both live lectures and video lectures would be equally effective for me.	27	25.96%
1	Live lectures would be more effective for me.	24	23.08%
4	Both live lectures and video lectures would be equally ineffective for me.	5	4.81%

2. Please elaborate on your reasons for the answer to the previous question.

Sometimes it is hard to find other time to watch the video lecture for the entire duration uninterrrupted.

sometimes i am busy or lazy then i forget to watch video but i will not miss lectures. besides, lectures make me feel more involved

I am fine with both methods of teaching

Video lectures can be replay or fast forward and we don't have to come to class.

I would not be able to procrastinate live lectures

I like to have live lectures because if there is any question I clear my doubt during breaks or immediately after the lesson. While video lectures allow me re-watch the video for revision.

Had difficulty following what was written on the whiteboard.

I think live lectures are more enjoyable. On the other hand, video lectures can save time for student.

Able to watch whenever I am free. Video qualities can be improved though.

The video lectures are well-organized. It is helpful to be able to review the videos/past materials but in lectures, we can raise questions and discuss new problems.

This is because when we have doubts we can ask that moment . Sometimes do not understand the speaker , he is just going through what is written in the slides exactly the same way.

I do not feel as though I am being taught well, especially when using some other teacher's videos. There is a lack of connection.

To be fair I am overloading, but video lectures allow me to watch lectures on the go and save time. I can speed up the video and make everybody sound like chipmunks so I can stay awake.

Live lectures would explain more clearly and also the video quality is quite bad, all blur

Live lectures can be more effective as we can ask questions during the lecture. Video lectures allow us to learn at our own pace.

Firstly, the video qualities are so low. I can't even see the words on the board sometimes. 2ndly, some of the concepts are pretty difficult to understand, and it will be nice to be able to clarify and doubts on the spot.

Video lectures allow me to stop anytime when I am not following the lecturer and also skip some parts that I have already known. I can take the lecture on my pace.

I prefer attending lectures. I do not watch the videos.

Sometimes it is a bit hard to understand the video lectures. A live lecture that revises what the video lecture has cover will help greatly plus will help put into things into context

Because I found it very hard to concentrate in a large and spacious lecture, so it's more efficient to watch the videos myself.

Some times during the lecture I will zone out. During a live lecture, I will lose out on content. However for video lectures, I can just pause the video and review it again when I am focused.

Some students may not attend live lectures, so there is a need for video lectures to look through it during the free time. Some students also need live lectures in case they have

questions to ask directly.

I can view it at my own pace. I like how the video lectures are broken into smaller parts.

Video lectures allow me to learn at my own pace and to digest content at a deeper level on my own. Live lectures is fun and keeps me on track. Having both would help in my learning.

Video/webcasts best suited for me cos can pause if I'm tired, rewind if I missed something. No attention span for lectures

Although the notes and videos are pretty clear, I still prefer live lectures to clarity doubts right away

Able to pause the video to take down notes, otherwise webcast is essential.

It allows flexibility with regards to the time we "attend" the lesson.

I prefer watching webcasts than attending live lectures as I find it easier to concentrate.

Watching lectures before coming to class makes me more prepare and easier to understand what the prof is talking about.

It allows me to study at my own pace, and the videos are separated into parts which allows me to spread them out instead of having to sit through a 2 hr lecture.

Having the ability to repeat the lecture is convenient.

In the lecture, I can discuss with my neighbor and really think about the answer.

Less motivation to watch pre recorded lectures than a live one

Video lectures can serve as preparation for live lectures.

I can learn at my own pace.

Fall asleep while watching video lectures. But I enjoy the american accent of video lectures better.

I just prefer live lectures

I can play the video whenever I want and adjust the speed.

As long as the content and delivery is not too different, it does not make much different to me

Video lectures don't seem to correspond with the material very tightly, whereas live lectures' pacing are too slow.

Video lectures is more effective.

Video lectures allow for playbacks. Live lectures enforced my understanding on the video lectures. But I rather the live lectures/recitations be an explanation/repeat of the video lectures to enforce what I learn from the video lectures, rather than just doing questions.

More used to it

The quality of the video lectures are really, most of the things written on the board is impossible to see.

Live lectures give students to clarify immediately while in doubt. However, for video lectures, if students cannot follow through, can pause the video and go through many times to get a better idea so both are equally effective.

I like the current flipped classroom format! It is well-paced.

Live lectures is more time effective as I am required to keep up throughout the lecture. In video lectures, the option to pause excessively is not good.

The videos teach the chapter, the recitals can be used to clear doubts about the chapter if any and to practice with questions related to the chapter

Good for both.

I learn the best, both in terms of speed and understanding by self studying (reading materials that I find explains things in ways I can understand faster and better, finding materials such as YouTube videos that explains things in ways I can comprehend and can tune it to the speed that I can understand)

Video lectures can be replayed in parts easily or played at different speeds.

Can play at my own pace and replay them when necessary.

Live lectures may appear to be more interactive and can focus better. Video lectures quality is too bad

The lecturers at MIT are really good. Since we already have highly rated course lectures like these... Prof you can rest and no need give lecture HAHA

Can watch anytime I want.

I can watch the video lecture on my pace and review it at any time I want.

More suited to my pace. Many times when i was watching the video, i need to pause to absorb the information and understand what is going on before moving on.

The MIT lecture videos are very helpful as the explanations provided are easy to understand

Direct interaction is only possible in live lectures. Even live online lectures are preferred over online videos

I can replay 100 times.

I can easily stop and reverse the lecture video if I do not quite understand any topic of the lecture.

For me I will absorb the content better if I have the opportunity to choose when to learn it. Watching live lectures 'force' me to absorb the content in that stipulated time frame, while video lectures allow me to learn when I'm ready to do so.

Flipped classroom are helpful if the lesson materials are self sufficient. That way, the video lectures will simply be a helpful guide. For this module, the content can be difficult at times, and some materials in the slides require elaboration, therefore I feel that live lectures will be more useful.

I can always go back or pause when i get confused. But it will be better if the quality of video lectures can be improved.

Greater flexibility (pause, slow down/speed up etc)

The problem with live lecture is that it is difficult to ask questions in such context , once stuck at a certain point, it is extremely hard to continue following the rest of the lecture(at least for me, not sure about others). Another problem is it takes time to think about what

the lecturer said about certain point, what is obvious to lecturer may not be obvious to me, also what is obvious to most student may not be obvious to other students. It is also hard for lecturer to keep on pausing to explain more/answer student's queations - > not enough time to complete syllabus. So, video lecture solve the problem by allow me to slow down, rewind and listen , pause and digest. However, there is still another problem unsolved, it is equally difficult to ask questions in both live lecture and video lecture. During the holiday i have been taking courses on Shawacademy.com, the approach is to conduct live video lectures. Students will type in questions while listening to the live video lecture (webinar) at chatbox, lecturer will check the questions queue once in a while throughout the lecture, and selectively answer students questions before moving on to the next point. In this way , lecturer can control the duration of the lecture while at the same time help students to clear their doubt so that they can follow the lecture smoothly (without getting stuck all the time and cannnot understand the entire lecture like i do). The best part is, after the lecture has ended, while some students need to rush to the next lecture or understood everything with a happy smile, they can leave. But those who have full of doubt and have no idea what is going on, can stay back and shoot questions at lecturer in real time while memory is still fresh.

---

too easy

I can speed up, slow down, rewind and view at my own time/pace. Its a lot more flexible.

---

so that when i do not understand i can rewatch it

It allows students to watch the videos at their own pace. However, the complex structure of the module means that sometimes, more explanation of certain content are required in order to truly understand the topic.

I am able to rewind videos on parts that I cannot understand.

Video lectures are low quality and sometimes it is unclear what is being written on the board. Also, hard to clarify with the prof immediately if have any questions.

Actually, I would choose the first option. I think this applies only to people like me - but I tend not to look at lectures when they are only available online, I prefer going for lectures. Then again, I do not attend lectures regularly, so video lectures are a good choice as well. If I were more consistent, I think video lectures are more effective.

I can watch the video lectures at my own time and speed it up/slow it down/replay to fit my own learning curve.

Video Lectures allow me to constantly revise topics while the lecture can focus on the application.

i learn better from live lecture but may missed out some parts at times. video lecture allows me to fast forwards parts that i had understood and go back to parts where i have problem understanding. both have its pros and cons.

Video lectures are good if we rmb to watch them. Live lectures are gd for covering our misunderstandings on the spot.

MIT lectures are awesome.

Live lectures for recitation and video lectures at home gives me the flexibility of 'attending' lecture anywhere and wherever I want by a very interesting lecturer in MIT. personally I fall asleep easily due to my short attention span and this is extremely helpful as I can learn on my own time and schedule and Google concepts while having her lecture paused when I don't understand, ensuring I don't miss concepts, keeping my engaged with the lecture and materials.

The advantage of video lectures is that you can rewind and watch them at your own pace. The biggest disadvantage is that you cannot ask any questions and get immediate feedback.

i am able to watch it from home MIT lectures are interesting and easy to understand Forces me to watch since no live lecture to attend Able to munch of snacks as i watch without distracting others Able to repeat content as many times as i like

It does not matter whether it is online or offline, live or video.

Unless the live lectures are also webcasted, video lectures are more effective as I can pause/rewind to the parts that I don't understand.

Video lectures are more effective 'cause can pause and replay.

I will be able to watch the video multiple times in case I am not able to catch it the first time. I can also control the speed at which the video is played-back at.

Can pause at any time i want to fully understand the concept being taught

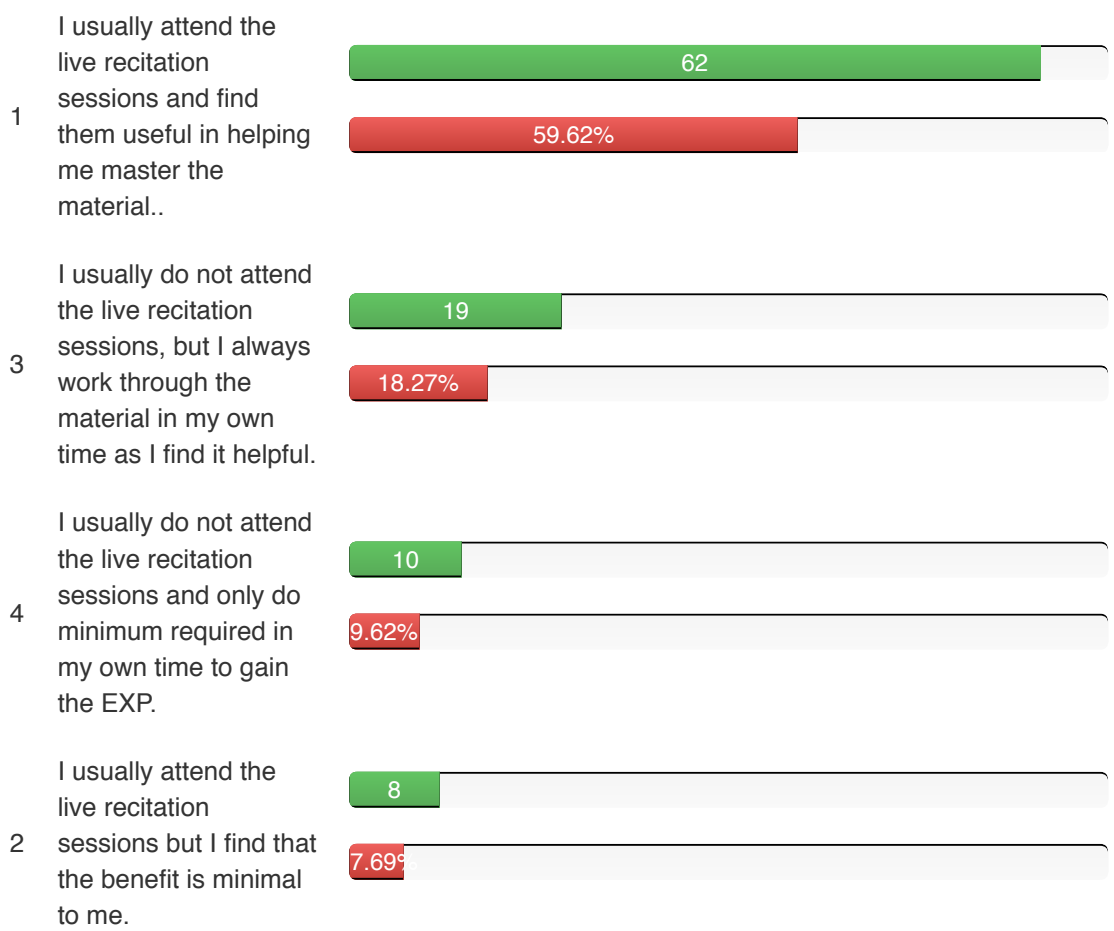
I can pause videos, but it's easy to get distracted on the computer.

More time flexibility, but requires clarity in recorded lectures.

More flexible for timetable

3. Is the recitation structure useful in helping you master the material?

No of respondents: ***104***



5 None of the above.

4. Please elaborate on your answer to the previous question. Please also give feedback on the pace of the recitations if you usually attend.

It is really useful to test conceptual understanding of the topics taught that week, especially the structured questions.

the recitation is ok

The pace is ok

I found the explanation on coursemology is enough for me to understand the question.

Questions asked are interesting and thought-provoking. Pace is good.

Since sometimes, I re-watch the video several times and still don't understand, the live recitation can sometimes help me to understand the basic with clear explanation.

Helps to clarify and build on to the lecture videos.

The recitation is one of the limited means of practice in this module so it is quite useful after all. I don't attend the live sessions because the pace is manageable and I normally don't read the new lecture note at the beginning of the week (My schedule is busy at the beginning of the week).

MCQ questions can be a bit faster.

More questions can be covered

Explanation and going through examples help me learn .

I think recitations are good except that the professor doesn't understand where the class is at because he is not doing the lectures himself. I feel as though the professor has certain expectations of what the class knows already and that they are higher than where the class actually is.

I cannot wake up in time to attend the recitation.

It is quite useful for me to understand the material after attempting the recitation problems

Questions there can help me better understand the materials. Sometimes, the explanations are too fast for me to catch anything.

I think the group discussion part during recitation is not very conducive.

I do not have time to attend recitation due to I am doing IA this semester, but the material actually helps me a lot in understanding the lectures

Can test my understanding and ensure that I am following the lectures. Pace is ok.

Recitation is helpful as it helps to reinforce the contents taught during the video lectures. However, it will be helpful if the lecturer goes through again what the video lecture has covered incase there might be information that have been left out in the video

I am very busy this semester so I can't usually catch up with the lectures at Tuesday. However I would like to attend after I catch up with everything later

The materials provided are usually sufficient to cover up for the recitation missed. I have been to several recitation sessions and found that the amount of material absorbed when I attend is equivalent to when I don't attend them.

The pace is just nice. Recitation questions and solutions are well explained and easy to understand.

There are more examples and more in depth concept explored during recitation. The pace of recitation can be faster I feel.

I do my self-learning to save travel time

MCQs usually quite easy but structured hard

Live recitation put the new contents into practice right away

Good, always helpful for revision, learning new things, making corrections.

I find it useful to have some discussion with my peers, as well as hearing the explanation.

The pace of the recitation is alright, and recitation sessions provides a recap on the webcasts which is useful

By working on question helps me to better to understand the concept. It will be better if the prof can invite questions at the end of each question (if he has not done so)

I attended for the first 4 weeks, but did not attend after that. While it's great to listen to the explanations, the time limit given when doing the structured questions makes me unable to complete it before the time is up. As I'm not very good with the mathematical side of this module, I find that being able to work the questions at my pace is more beneficial for me.

Hard to focus all the way

The benefit is minimal because compare to I watch video, it is slow or not efficient in the live lecture.

I don't like watching recorded videos. I am learning course materials during recitation

Recitation reinforce materials covered in video lecture.

It is a good recap and I learn from the harder questions.

Helps confirm concepts

I learn most during tutorials. Recitation a bit useless

It's very helpful to attend, do the exercise with the class and discuss with classmates.

It allows me to utilise and try out the different questions which is very helful

Recitations have too few questions for the feedback required to learn the material fully.

I usually attend the live recitation sessions, but I always work through the material in my own time as I find it helpful.

Recitation session enforced my understanding from the video lectures.

Hope there'll be webcast

Recitation abit too slow

During the recitation, students can try out on their own before the actual answer is given so even if the students' answers turn out to be wrong, it still gives a chance for students to come out with a variety of answers. The pace for MCQ is alright but I think more time should be allocated for the structured question.

I like :D

It gradually starts from basic definitions to structured questions. I feel that less time can be allocated for the basic questions, or we can switch some of the structured questions over to tutorials.

I do not usually have time to attend recitals due to other deadlines within the week, but when i do find the time i will spend the time to go over the lecture, videos and recital materials in detail. A lot more time is needed to understand the material due to it's intuitive-based nature.

There is sufficient interaction.

I do not attend the live recitation session and I will work through the material on my own time to test the level of my understanding in a short time. Afterwards, I will look at what I got wrong and source for materials (see answer to Q2) to bridge the gap in my understanding.

Live recitation is not really helpful as it is no different than doing and checking the answers on your own. Extending the tutorial may be better.

Live recitation can be quite slow when going through the MCQ questions. Would like more time to be spent on going through the structured questions

Most of the time when i watch the video lectuer, i don't seem to understand especially the beginning chapters. going to recitations do not seem to clear my doubt as well (went for 2 recitations) hence i gave up and tried to work on my own.

Questions are well-thought, help in understanding. But isn't a 1h30min lecture + 1h30min recitation + 1h tutorial a little bit too much workload-wise? There's a lot of content to cover every week, and this is worsened by PAs and Homework assignments, although they do help in enhancing understanding

Recitation questions not too challenging.

Because in the recitation I can do some practice and use the theory I learned in the video to solve more practical problems.

The recitation sessions kind of forces students to always be on track with the curriculum schedule, which may or may not be appreciated by all students. Generally, it helps students to learn better.

MCQ part of recitation is too slow

because it is not webcasted, i cannot repeat anything that happened at the recitation sessions

It can help me to understand the topic more deeply.

The recitation session certainly provides a quick check on the materials I have learnt from the video lectures.

The pace is good. I find the recitation material really helpful as the tutorial practices are very minimal.

I think the recitation questions are helpful for me to test myself whether i have mastered this week's lecture or not.

would be better if live recitation sessions are webcasted

too easy

The questions that are gone through during recitation helps in the understanding of the material.

sometime i still dont really understand what the proff is saying.

The pacing is good (with a quirky last MCQ question).

Pace of recitations is good. I would prefer more open ended questions instead of MCQs since exam questions are open-ended.

So far I attended half the recitation sessions... It is more helpful if I managed to read up about the topic beforehand, so if anything it would be kind of my fault if I don't find the sessions useful.

I think it is faster for me to do the recitation by myself than to attend the live session.

Recitations are generally well-paced, though web-casting them might be beneficial for revision. (I've attended all recitations)

i learn better from live lesson so it helps me to master the material better especially after watching the video lectures with some knowledge of the content. it would be better to go straight to discussion than to have 2 parts of the same question so more time can be spend on the second part of the lecture.

Good for covering the more advanced material and to cover any misunderstandings

Recitations are very helpful but there can be more challenging questions.

Live recitation is useful especially for the structured questions. Cements what I learn in the online lectures. Also makes people spend more time unconsciously on the module putting in the hard work without realizing it. Very good structure especially for people needing help to be self disciplined

I feel that the recitation sections move too quickly and it would be better if we did less problems, but spent more time explaining and understanding them.

Prefer working through the answers myself first

It's not bad.

I usually am slower at grasping concepts so I don't think the pace is bad.

Recitations are useful as there's explanation and discussion involved. However, I would prefer a webcast of the recitations so that I can review it later as well.

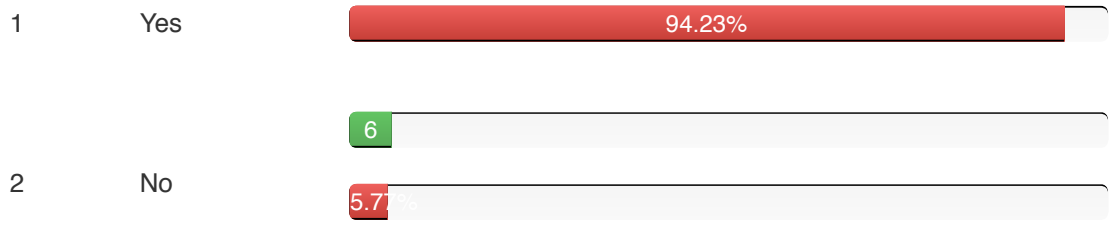
The notes for the live recitation provides me with a sense of the type of questions that may come out for tests.

Questions are challenging.

Too many projects this semester, poor time management on my side. Pace is fine, but could give more time in answering / reading quiz questions.

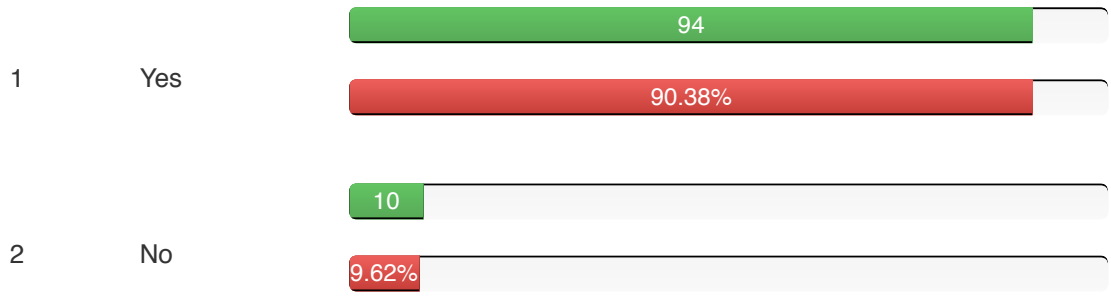
I find it useful for revision, but some weeks when I have more workload, I put my revision off till Monday-Wednesday when I am more free. As such, when going through the recitation I have not yet studied that topic yet.

5. Is the use of technology for the MCQ questions in recitation helpful? *No of respondents:* ***104***



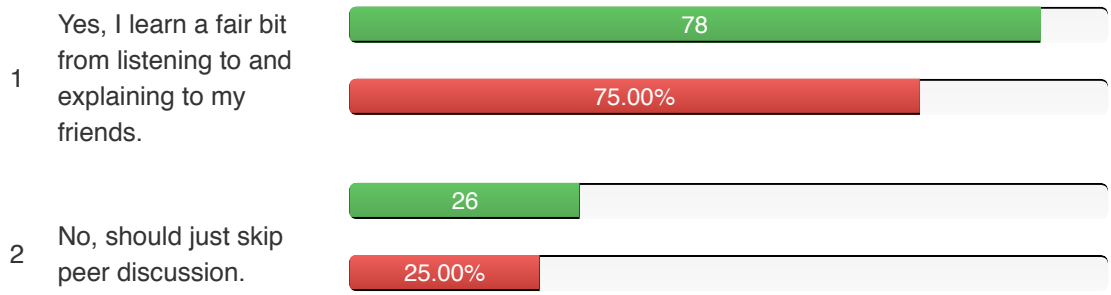
6. Is the use of technology in the tutorials helpful?

No of respondents: ***104***



7. Is the discussion with your peers during recitation helpful?

No of respondents: ***104***



8. Please elaborate on your answer to the previous three questions on technology and peer discussion in recitations and tutorials.

MCQs are not that useful. More focus should be on the structured questions. The MCQ could be done by ourselves to check our understanding after watching the lectures.

i want tutors to share more information.

I am not too sure if this just happens to me. I feel that peer discussion usually ends up with everybody getting the same answer, or everybody disagreeing but not knowing how to convince others.

We can participate and earn points at the same time.

Tutorials should be a time to make mistakes and learn, and penalties for making mistakes shouldn't be given then! There are instances where a student can score 0 for the tutorial, then he might as well don't attend the tutorial.

I think it is convenient and peer discussion helps you learn a bit form friends.

Technology "forces" everyone to try the question, so that's good otherwise some people may not bother trying.

I like the auto-grading of mcq questions and the explanation provided after an answer/training is submitted

Sometimes during discussions we think of different ideas and sometimes we get confused. Which the tutor clears up then.

I think practice is important and helpful. Not sure what technology is being used??

Having everyone lock in their answers forces people to actually think about their answer even if they are depending on their friends to supply the answer. Discussion is also good to see how other students approach the problem.

Sharing ideas is quite useful

I think it would save time if we just get straight to the explanations. The time saved can be on the explanations. This can help slower students like me to better understand the material.

Will be nice to have open ended questions during tutorial as for this module there is alot of proving to do and we could use some practice.

It gives you time to think and discuss. On one hand, you can check your understanding. On the other hand, you can learn from your group mates.

Sometimes there are technical issues with coursemology such as unable to log in or cannot access the tutorial session. There was a tutorial that no one can access the session so have to manually collect answers. The experience from that tutorial is not given yet.

MCQ allows me to have a rough idea what the answer should be like and if I'm unsure of the answer, peer discussion is helpful in allowing me to understand the question better.

It's good to listen to how different students think about the same question in different ways

Yes, the use of technology during tutorials and recitations is indeed useful. Discussion with peers is really useful as I can further confirm my understanding of the subject matter.

Time is given to think carefully about the answer to the questions and to discuss with peers. So everyone have a fair chance to understand and share their opinions on the answer. And more importantly, a well detailed explanation by the tutor gives even more understanding on the questions.

The discussions help but only for certain questions which are tougher and useful to know how others tackle the same question differently.

I don't attend recitations

Not bad, can see responses

Fast and effective learning through discussoins

Just allow peer discussion from the start, but encourage individual thinking before discussion.

While it is interesting to find out what other people think about the questions, I still find it more useful to skip the peer discussion

It will be helpful if there is someone know the answer around me, so then we can discuss the answer.

We're computing students. We embrace technology. =D Discussion helps me to remember what I've learned during tutorials.

Tutorial sometimes doesn't work well and do not show up to review

They are somewhat helpful... because I can hear different people's opinion and think of my answer if it's correct.

More engagement in the module helps in rote learning

Convenient for q5 and q6. Discussion allow us to understand better.

Explaining to one another helps in clarifying some misunderstandings that might be unanswered if there was only a tutor, and the lesson is more interactive and engaging.

Discussion is good

It's helpful and easy to review in the future.

I think this way of doing things is useful as well get to try out and force to compare and present our answers to our peers

Discussion is interesting, but sometimes they result in "follow the herd" answers. Usually being the one explaining helps to enforce the concept of learning, so that is beneficial to

me.

Exchange of ideas and discussions are very helpful.

I find it stressful to have to hold discussion with strangers.

From the statistics of the students' answers, it gives a rough idea of other students' performance so can work harder if one's performance is not par with the others. From peer discussions, explaining to others enables students to get a better idea of the concepts more clearly.

Not bad, but the coursemology platform is a bit slow.

Peer discussions during tutorials are useful, but during recitation it is minimal and time is wasted.

the use of technology allows students to interact better and discussing during tutorials helped me to understand the concepts needed to understand each question/chapter much better

MCQs allow me to know the statistics of the class and discussion of my thoughts with peers always helps me learn better.

The technology is great for both tutorials and recitations, you get to commit to an answer first and know if there is a gap - without having the chance to give ourselves excuses when we "are not so sure". Identifying gaps is great for students to find out what they need to revise / bridge. On the side of peer discussion during recitation, I find it less helpful (the first and only time I attended) because people understand the same material in different ways and the "groups" are sometimes too small (just between 2 people for instance) for the discussion to bloom, if say both of them do not understand what is going on. In tutorials when the discussion can go up to more people, there is a higher chance at least one person gets it and can help to steer the group discussion.

There is usually little discussion as most of the times, everyone would already have reached the same answer when doing the question themselves, and the time given is not used productively.

Better than IVLE

Can easily input answers. However, should allow students to do tutorials outside of class time too.

Practice and discussion make the best!

Though I do not attend recitations, I always either google or discuss with friends if I don't understand.

Using technology to keep track of the answers so far and as a form of small test is good to enforce learning.

Human interaction is preferred

Both MCQ questions in recitation and tutorials help me to understand the concept of the topic and they are less boring than answering long questions so I am more interested in doing those questions for understanding the topic more thoroughly. Peer discussion is also useful that I can usually understand more about the answers from my classmates and they answer my questions patiently.

The discussion with my peers provides me the opportunity to think about the question in various perspectives. Sometimes they point out misconceptions which are important learning points in the module.

I find it useful in that it helps log my answers without writing. The answers and explanations are also clearly stated without the need to write, allowing us to focus more on thinking. However, I feel that time for peer discussion can be adjusted accordingly instead of fixing it as most of the time, it can be too long.

In the recitation, we are required to discuss among ourself first, in this way I can be more clear about the reasoning when explaining to others.

tutorials only test MCQ, doesn't help with answering structured questions in exams. peer discussion is inefficient use of time because tutors are generally able to explain better than peers.

Peer discussion confuse me more.

too easy

The live answering helps because students get a sense of involvement in the process. As for peer discussions, some people have no peers to discuss with:(

MCQ questions in recitation and turorials are too easy as compared to the exams, and does not provide a good feedback as to whether I understood the material.

More effective learning, everyone participates. Also peers typically know better than me so I have benefited a lot from the discussion.

There is immediate grading and feedback when I do recitation (and other revision). Having peer discussion is nice, but sometimes, the groups can be very quiet and/or afraid to ask questions.

The individual answer timing should be shortened and greater emphasis given to peer discussion.

most questions requires written proofs so having mcq is not very helpful for tutorials.

Good group discussions during tutorials and during recitations. Glad that there is less focus on individual work than other modules, individual and group component is great during tutorials. Less time is spent figuring out stuff you don't know and in tutorials you can learn things fast from others without cracking your head solving problems on your own at home.

Tutorial format helps me understand the basic concepts behind topic Answer voting system works well in a larger group Personally like the system where you pick the answer first then

having a second round of answer because, 1) if mistakes were made, it is immediately corrected in the second round and i remember it better (since it was a mistake) 2) usually ensures correct answers since majority votes the right answer

The current structure is not bad.

Certain questions do require us to think harder and the discussion helps us in finding an answer as opposed to individual random guessing.

Learning becomes more effective when the contents are being discussed and when we're constantly being tested.

It is good that there is a platform for students to share their ideas on which answer is correct as different people may have different views.

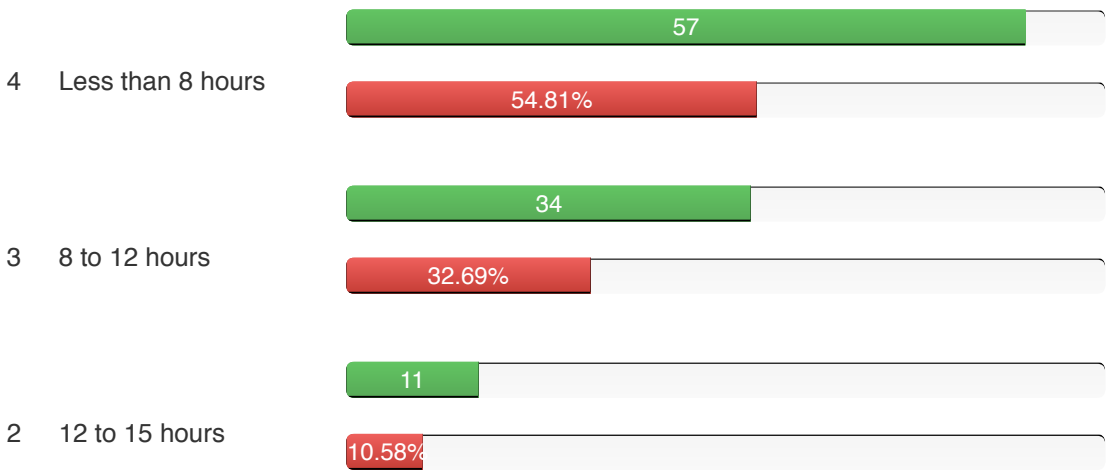
Others solve it for me.

MCQ is easy to mark and validate. Requires explanation to justify your answers. Peer discussion helps to clarify doubts and understand different thinking procedures and approaches to questions.

Get to clarify doubts

9. On average, how much time do you spend on this module per week?

No of respondents: ***104***



1	More than 15 hours	2 1.92%

10. Which would you prefer, if you had the option to do the course over again? *No of respondents:* ***104***

1	Flipped classroom, with tutorial and optional recitation focused on problem solving, as done this semester.	74 71.15%
2	The usual lecture and tutorial style course.	30 28.85%

11. Please give any other feedback you have here.

Tutorial slots need to be longer.

up till now, ok for me

I would like having all three of lectures, recitations and tutorials

I still prefer the usual lecture because some of the MIT videos are too blur and I have to pause quite a few times to see some of the writings that the prof wrote on the whiteboard to understand it.

I find this module quite a "bully", unfortunately, that penalises student in tutorials, which is NOT conducive for learning.

Good!

More can be covered during tutorials if there are more questions / students are prepared. There can be some take home tutorial exercises in addition to the quizzes in tutorials.

Grouping should not be enforced.

I feel both have their pros and cons and you cannot choose one option in this case.

Hopefully the finals can be easy.

I would like to have more regular exercise every week, like structured questions for the material on this week to examine own understanding before attending any recitations or tutorials

None.

Wish there's more questions on mid term questions that is structured rather than mcq. So that students know what formula and algorithms to apply for each of the structured questions.

Some mcq questions like too easy for tutorials, maybe can challenge us more

Very good, but examinations should test knowledge on the materials and not too much factor on lucky inspiration for problem-solving within the time limit.

Workload may be a bit overwhelming at times depending on period of semester and other modules taken.

Students tend to ask more questions if they have previewed the materials before hand. I like to solve questions together, which can reinforce the understanding.

Maybe spend more time on lecturing instead of doing mcqs.

Lecturer can reinforce stuff in live lecture that we may have overlooked in video lectures

I like this style more.

Very well planned out lectures material with good use of recitation and tutorial time

Please provide more questions and practice. 5 mcq questions per recitation/tutorial is too little, and difficulty of questions do not correspond to the tests. It would help to provide additional practice for us to understand the material at a deeper level.

Current structure of flipped classroom is really great. It enables me to learn the concepts at my own pace while having more practice by applying the theories on the problems during recitations and tutorials.

More practise exercises (ungraded, of course)

Nil

Maybe spread out the workload, in order to have less heavy workload in the second half of the semester.

This current option makes it more flexible for students like me who prefer to spend time in ways that is most optimized for myself - the usual lecture and tutorial style courses make it such that all of us has to conform to one style of pedagogy and what some of us can learn on our own within 3 hours a week ends up taking 10 hours a week

Nil.

To have more open-ended questions during tutorials, rather than only MCQs.

Provide better quality videos. Don't like flipped classroom:(

Give more thought provoking questions

recitations should have webcasts too

This is my first time to have a flipped classroom style but I think it is better than the usual one.

Overall, this is the module that I feel encouraged to learn and discover more. It is the best flipped classroom model that I have seen as compared to the other modules. This module not only provides a wide range of questions to test our understanding, it also provides room for discussions about these questions posted in the recitations and tutorials. Good job!

I believe that the recitations are useful, and it can be combined with the tutorials.

It is very good for people like me doing internship and do not have the choice to go to live lecture.

video quality of lectures are poor. Please have webcast for recitation.

The problem with live lecture is that it is difficult to ask questions in such context , once stuck at a certain point, it is extremely hard to continue following the rest of the lecture(at least for me, not sure about others). Another problem is it takes time to think about what the lecturer said about certain point, what is obvious to lecturer may not be obvious to me, also what is obvious to most student may not be obvious to other students. It is also hard for lecturer to keep on pausing to explain more/answer student's queations - > not enough time to complete syllabus. So, video lecture solve the problem by allow me to slow down, rewind and listen , pause and digest. However, there is still another problem unsolved, it is equally difficult to ask questions in both live lecture and video lecture. During the holiday i have been taking courses on Shawacademy.com, the approach is to conduct live video lectures. Students will type in questions while listening to the live video lecture (webinar) at chatbox, lecturer will check the questions queue once in a while throughout the lecture, and selectively answer students questions before moving on to the next point. In this way , lecturer can control the duration of the lecture while at the same time help students to clear their doubt so that they can follow the lecture smoothly (without getting stuck all the time and cannnot understand the entire lecture like i do). The best part is, after the lecture has ended, while some students need to rush to the next lecture or understood everything with a happy smile, they can leave. But those who have full of doubt and have no idea what is going on, can stay back and shoot questions at lecturer in real time while memory is still fresh.

why is this course easier than 2020

Overall, this module is manageable and the material are quite interesting.

I feel that some open-ended questions are better to be discussed in tutorials as having MCQs is slightly not enough to prepare ourselves for tests and exams (there are no MCQs in those).

The explanation during the video lectures could be more clear as some parts took me really long to understand and sometimes the slides are just being read w/o much explanation.

The content is really difficult to grasp though

Probability should be taught more in depth especially for students who have little background in it. (Probability is not a pre-requisite, and I have a number of friends struggling with it)

Great course structure. Coursemology needs more work as it is buggy and probably could do well with more responsive design. If possible, I would be keen to help out with Coursemology.

Nothing much. I like the current way.

Live lectures would be great, along with webcast so that I can easily rewind and replay the parts that I cannot understand.

Better to have open ended questions rather than pure MCQs during tutorials.

Since I am taking it with a friend, we watch the online lectures together. Had I had no such companion, the experience would not have been as pleasant/enjoyable as it is now.

If only we can have extensions for the upcoming deadlines as I am really tight on my schedule and couldn't catch up.
